

Figure A7. (A) Digital borehole image, (B) slabbed core photograph, (C) thin-section photomicrograph, and (D) whole-core porosity and permeability data for the pedogenic limestone (root-mold limestone) rock-fabric facies of HFC3b for the G-3679 test corehole. Slabbed core sample (B) is from a depth of approximately 14.40 to 14.73 feet below land surface. The thin section photomicrograph (C) is from a depth of 14.6 feet below land surface.
