

Figure A9. (A) Digital borehole image, (B) slabbed core photograph, (C) thin-section photomicrograph, and (D) whole-core porosity and permeability data for the skeletal grainstone and packstone rock-fabric facies of HFC2 for the G-3679 test corehole. Slabbed core sample (B) is from a depth of approximately 28.11 to 28.48 feet below land surface. The thin section photomicrograph (C) is from a depth of 28.3 feet below land surface.
